

**IN THE CLAIMS:**

This listing of claims will replace all prior versions, and listings, of claims in the application.

Claims 1-17 have been canceled and claims 18-36 have been added as follows:

**Listing of Claims:**

Claims 1-17: Canceled

Claim 18 (new): A conductive-contact holder that accommodates at least a signal conductive-contact that is a conductive contact for performing input and output of a signal for a predetermined circuit configuration and a ground conductive-contact that is a conductive contact for supplying a ground potential to the predetermined circuit configuration, the conductive-contact holder comprising:

- a holder base that is formed of a conductive material, the holder base including
  - a first opening for accommodating the signal conductive-contact; and
  - a second opening for accommodating the ground conductive-contact while maintaining an electrical connection with the ground conductive-contact; and
- an insulating member that covers an inner surface of the first opening.

Claim 19 (new): The conductive-contact holder according to claim 18, further comprising:  
a conductive pipe member disposed in the first opening so that an inner surface of the conductive pipe member is in contact with the ground conductive-contact.

Claim 20 (new): The conductive-contact holder according to claim 18, wherein  
the holder base is formed of a material conforming to a thermal expansion coefficient of the predetermined circuit configuration.

Claim 21 (new): The conductive-contact holder according to claim 18, wherein  
the holder base further includes

a third opening for accommodating a power-supply conductive-contact that supplies  
a power to the predetermined circuit configuration; and  
an insulating member that covers an inner surface of the third opening.

Claim 22 (new): The conductive-contact holder according to claim 18, wherein  
the holder base further includes

a first substrate that is formed of a conductive material, the first substrate including  
a fourth opening corresponding to the first opening; and  
a fifth opening corresponding to the second opening; and  
a second substrate that is formed of a conductive material, the second substrate  
including  
a sixth opening corresponding to the first opening; and  
a seventh opening corresponding to the second opening,  
the second substrate is fixed to the first substrate so that the sixth opening communicates with  
the fourth opening and the seventh opening communicates with the fifth opening, and  
the insulating member includes  
a first insulating pipe member inserted into the fourth opening; and  
a second insulating pipe member inserted into the sixth opening.

Claim 23 (new): The conductive-contact holder according to claim 22, wherein  
the first insulating pipe member includes an anti-slip flange formed in one end thereof,  
the second insulating pipe member includes an anti-slip flange formed in one end thereof,  
and

the first insulating pipe member is inserted into the fourth opening and the second insulating  
pipe member is inserted into the sixth opening so that the anti-slip flanges are positioned on the side  
of a boundary between the first substrate and the second substrate.

Claim 24 (new): The conductive-contact holder according to claim 22, further comprising:  
a first conductive pipe member that includes an anti-slip flange formed in one end thereof,  
and is inserted into the fifth opening so that the anti-slip flange is positioned on the side of a  
boundary between the first substrate and the second substrate; and  
a second conductive pipe member that includes an anti-slip flange formed in one end thereof,  
and is inserted into the seventh opening so that the anti-slip flange is positioned on the side of the  
boundary between the first substrate and the second substrate.

Claim 25 (new): The conductive-contact holder according to claim 24, wherein  
the first conductive pipe member has an outer shape different from that of the first insulating  
pipe member, and  
the second conductive pipe member has an outer shape different from that of the second  
insulating pipe member.

Claim 26 (new): The conductive-contact holder according to claim 25, wherein  
the first conductive pipe member has an outer diameter larger than that of the first insulating  
pipe member, and  
the second conductive pipe member has an outer diameter larger than that of the second  
insulating pipe member.

Claim 27 (new): The conductive-contact holder according to claim 25, wherein  
the anti-slip flange of the first conductive pipe member has an outer diameter larger than that  
of the anti-slip flange of the first insulating pipe member, and  
the anti-slip flange of the second conductive pipe member has an outer diameter larger than  
that of the anti-slip flange of the second insulating pipe member.

Claim 28 (new): The conductive-contact holder according to claim 25, wherein

the anti-slip flange of the first conductive pipe member has a length in an insertion direction of the first conductive pipe member longer than that in an insertion direction of the first insulating pipe member, and

the anti-slip flange of the second conductive pipe member has a length in an insertion direction of the second conductive pipe member longer than that in an insertion direction of the second insulating pipe member.

Claim 29 (new): A conductive-contact holder that accommodates at least a signal conductive-contact that is a conductive contact for performing input and output of a signal for a predetermined circuit configuration, the conductive-contact holder comprising:

a holder base that includes an opening for accommodating the signal conductive-contact; and  
an impedance correcting member that is formed of a dielectric material and is formed to be positioned along an outer periphery of the signal conductive-contact while the signal conductive-contact is accommodated in the opening, and that corrects an intrinsic impedance of the signal conductive-contact.

Claim 30 (new): The conductive-contact holder according to claim 29, wherein  
the signal conductive-contact is in a cylindrical shape with a predetermined outer diameter,  
and

the impedance correcting member is in a tubular shape and coaxial with the signal conductive-contact, and corrects the intrinsic impedance by adjusting an outer diameter of the tubular shape and the dielectric constant of the dielectric material.

Claim 31 (new): The conductive-contact holder according to claim 29, wherein  
the holder base is electrically conductive.

Claim 32 (new): The conductive-contact holder according to claim 29, wherein the holder base is formed of a material conforming to a thermal expansion coefficient of the predetermined circuit configuration.

Claim 33 (new): The conductive-contact holder according to claim 29, wherein the holder base further includes  
a third opening for accommodating a power-supply conductive-contact that supplies a power to the predetermined circuit configuration; and  
an insulating member that covers an inner surface of the third opening.

Claim 34 (new): A conductive-contact unit comprising:  
a signal conductive-contact for performing input and output of a signal for a predetermined circuit configuration;  
a ground conductive-contact for supplying a ground potential to the predetermined circuit configuration;  
a conductive-contact holder including  
a holder base that is formed of a conductive material, the holder base including  
a first opening for accommodating the signal conductive-contact; and  
a second opening for accommodating the ground conductive-contact while maintaining an electrical connection with the ground conductive-contact; and  
an insulating member that covers an inner surface of the first opening; and  
a circuit board including  
a circuit that is electrically connected to at least the signal conductive-contact and generates a signal to be input to the predetermined circuit configuration.

Claim 35 (new): The conductive-contact unit according to claim 34, wherein  
the signal conductive-contact is in a cylindrical shape with a predetermined outer diameter,  
and

the insulating member is in a tubular shape and coaxial with the signal conductive-contact,  
and corrects an intrinsic impedance of the signal conductive-contact by adjusting an outer diameter  
of the tubular shape and the dielectric constant of the dielectric material.

Claim 36 (new): The conductive-contact unit according to claim 34, further comprising:  
a ground-potential supply unit that supplies a ground potential; and  
a connecting unit that electrically connects the holder base and the ground-potential supply  
unit.
